

AI ASSISTED CODING

LAB-4

P.v gayathri

2303A51909

BATCH-12

Task Description #1 (Privacy in API Usage)

Task: Use an AI tool to generate a Python program that connects to a weather API.

Prompt:

"Generate code to fetch weather data securely without exposing API keys in the code."

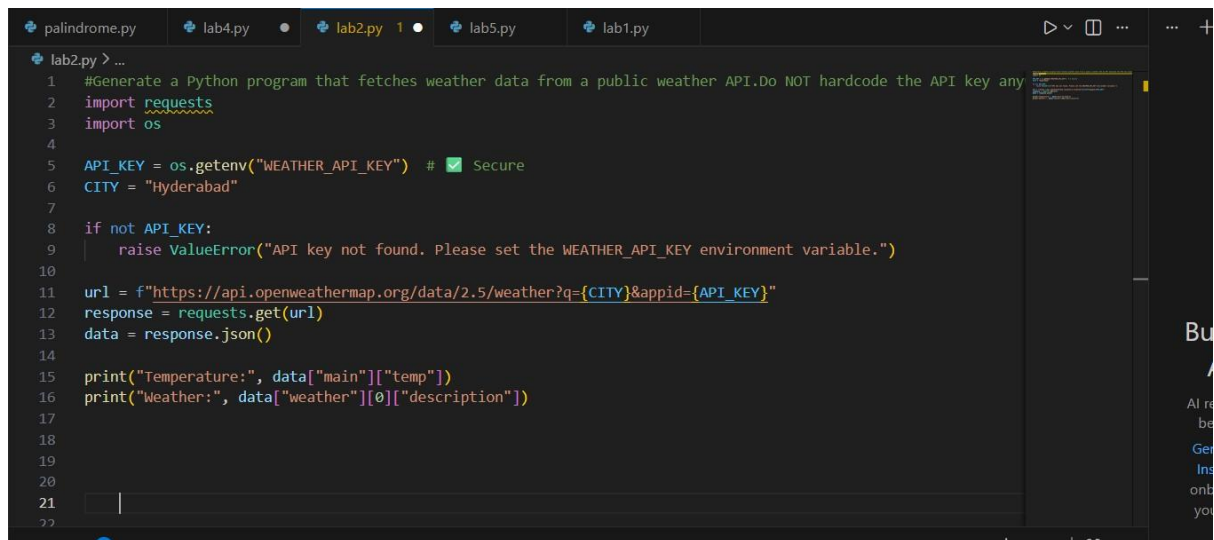

Expected Output:

- Original AI code (check if keys are hardcoded).
- Secure version using **environment variables**.

PROMPT:

#Generate a Python program that fetches weather data from a public weather API. Do NOT hardcode the API key anywhere in the source code. The API key MUST be read only from an environment variable using the os module. If the API key is missing, the program should raise an error. Do not include placeholder API keys in the code.

CODE:

A screenshot of a code editor with a dark theme. The editor has several tabs at the top: 'palindrome.py', 'lab4.py', 'lab2.py' (which is active and has a red dot), 'lab5.py', and 'lab1.py'. The active tab 'lab2.py' contains a Python script. The script starts with a comment: '#Generate a Python program that fetches weather data from a public weather API.Do NOT hardcode the API key any'. It imports 'requests' and 'os'. It sets 'API_KEY = os.getenv("WEATHER_API_KEY")' with a comment '# Secure' and 'CITY = "Hyderabad"'. There is a conditional check for 'API_KEY' with a 'raise ValueError' message. The script constructs a URL for the OpenWeatherMap API, sends a GET request, and parses the JSON response. It then prints the temperature and weather description for Hyderabad. The bottom of the editor shows tabs for 'PROBLEMS', 'OUTPUT', 'DEBUG CONSOLE', 'TERMINAL', and 'SOURCE'.

```
1 #Generate a Python program that fetches weather data from a public weather API.Do NOT hardcode the API key any
2 import requests
3 import os
4
5 API_KEY = os.getenv("WEATHER_API_KEY") # Secure
6 CITY = "Hyderabad"
7
8 if not API_KEY:
9     raise ValueError("API key not found. Please set the WEATHER_API_KEY environment variable.")
10
11 url = f"https://api.openweathermap.org/data/2.5/weather?q={CITY}&appid={API_KEY}"
12 response = requests.get(url)
13 data = response.json()
14
15 print("Temperature:", data["main"]["temp"])
16 print("Weather:", data["weather"][0]["description"])
17

```

Task Description #2 (Privacy & Security in File Handling)

Task: Use an AI tool to generate a Python script that stores user data

(name, email, password) in a file.

Analyze: Check if the AI stores sensitive data in plain text or without encryption.

Expected Output:

- Identified privacy risks.
- Revised version with encrypted password storage (e.g., hashing).

PROMPT:

#Write a program that securely stores user credentials by hashing the password and ensuring sensitive data is not stored in plain text.

CODE:

```
palindrome.py lab4.py lab2.py 9+ lab5.py lab1.py
lab4.py > store_credentials
1 #Write a program that securely stores user credentials by hashing the password and ensuring sensitive data is
2 import hashlib
3 import os
4 import getpass
5 def hash_password(password: str, salt: bytes) -> str:
6     """Hash a password with a given salt using SHA-256."""
7     return hashlib.sha256(salt + password.encode()).hexdigest()
8 def store_credentials(username: str, password: str):
9     """Store user credentials securely."""
10    salt = os.urandom(16) # Generate a random salt
11    hashed_password = hash_password(password, salt)
12    with open('credentials.txt', 'a') as f:
13        f.write(f"{username}:{salt.hex()}:{hashed_password}\n")
14 def main():
15     username = input("Enter username: ")
16     password = getpass.getpass("Enter password: ") # Use getpass to avoid echoing the password
17     store_credentials(username, password)
18     print("Credentials stored securely.")
19 if __name__ == "__main__":
20     main()
21
22 # This program securely stores user credentials by hashing the password with a random salt
23 # and writing the username, salt, and hashed password to a file. The password input is handled
24 # using getpass to prevent it from being displayed on the screen.
25
26

Task Description #3 (Transparency in Algorithm Design)

Objective: Use AI to generate an Armstrong number checking function with comments and explanations.

Instructions:

1. Ask AI to explain the code line-by-line.

2. Compare the explanation with code functionality.

Expected Output:

- Transparent, commented code.
- Correct, easy-to-understand explanation **PROMPT:**

#write a code to generate armstrong number checking functions with comments **CODE:**

```
lab1.py > ...
1  #write a code to generate armstrong number checking functions with comments
2  def is_armstrong_number(num):
3      """
4      This function checks if a number is an Armstrong number.
5      An Armstrong number is a number that is equal to the sum of its own digits
6      each raised to the power of the number of digits.
7      For example, 153 is an Armstrong number because 1^3 + 5^3 + 3^3 = 153.
8      """
9      # Convert the number to string to easily iterate over digits
10     digits = str(num)
11     num_digits = len(digits)
12
13     # Calculate the sum of each digit raised to the power of num_digits
14     sum_of_powers = sum(int(digit) ** num_digits for digit in digits)
15
16     # Check if the sum of powers is equal to the original number
17     return sum_of_powers == num
18
19 # Example Usage
20 if __name__ == "__main__":
21     test_number = 153
22     if is_armstrong_number(test_number):
23         print(f"{test_number} is an Armstrong number.")
24     else:
25         print(f"{test_number} is not an Armstrong number.")
