

AI ASSISTED CODING

LAB-3.5

ADAVELLI HARIKA

2303A51909

Batch-12

1. Select a simple task: "*Write a Python function to check if a number is prime.*"

Prompt 1:

Write a code to check if a number is prime or not input by user.

Given Code and Output:

```
lab3.py > ...
1  #Write a code to check if a number is prime or not input by user
2  user_input = int(input("Enter a number to check if it is prime: "))
3  if user_input > 1:
4      for i in range(2, int(user_input**0.5) + 1):
5          if (user_input % i) == 0:
6              print(user_input, "is not a prime number")
7              break
8      else:
9          print(user_input, "is a prime number")
10 else:
11     print(user_input, "is not a prime number")
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS

```
Enter a number to check if it is prime: 59
59 is a prime number
PS C:\Users\katta\OneDrive\Desktop\AIAC>
```

Prompt 2:

Write a code to check if a number is prime or not input by user using functions.

Given Code and Output:

```
 lab3.py > ...
1  #Write a code to check if a number is prime or not input by user using functions
2  def is_prime(num):
3      if num <= 1:
4          return False
5      for i in range(2, int(num**0.5) + 1):
6          if num % i == 0:
7              return False
8      return True
9  user_input = int(input("Enter a number to check if it is prime: "))
10 if is_prime(user_input):
11     print(f"{user_input} is a prime number.")
12 else:
13     print(f"{user_input} is not a prime number.")

```

Explanation:

- In all the tasks at first I asked a basic prompt without any requirements, then the response that was given was very basic.
- After specifying what I wanted in the next prompts the response that was given was more optimised and structured.
