

AI ASSISTED CODING

LAB-4.1

p.v gayathri

2303A51909

BATCH-12

Problem Statement 0:

A news aggregation platform wants to automatically categorize

headlines into Politics, Sports, Technology, and Entertainment without training a machine learning model.

Tasks to be Completed

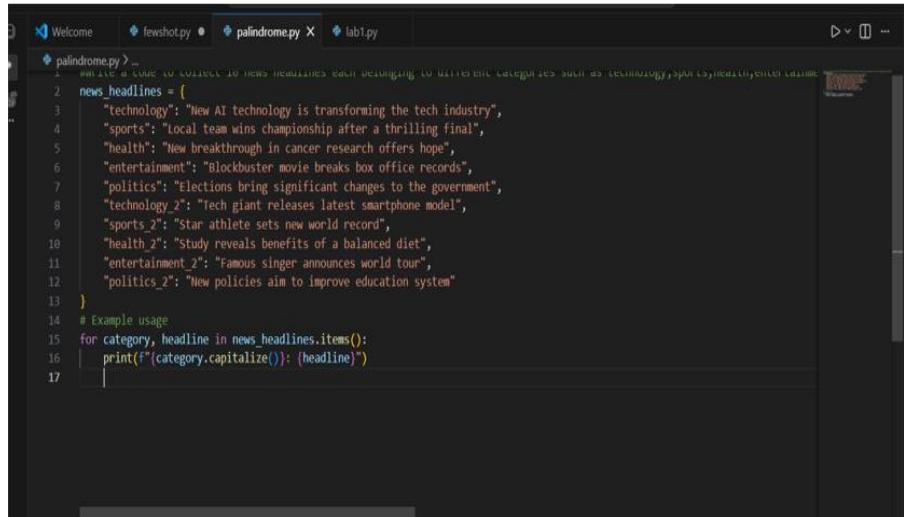

1. Prepare Sample Data

Collect 10 news headlines, each belonging to one of the four categories.

PROMPT:

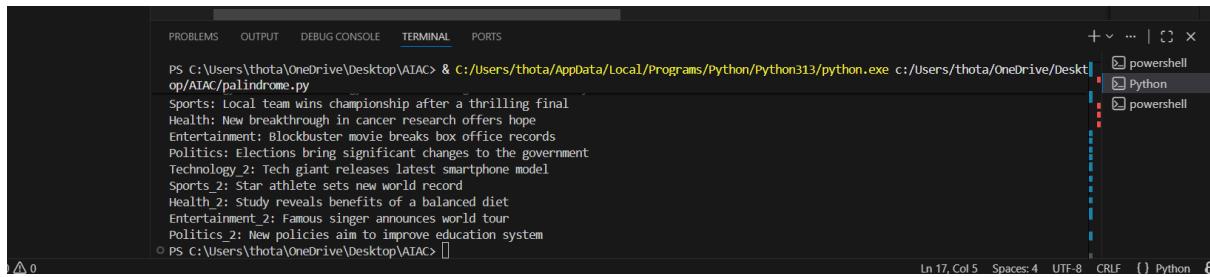

#write a code to collect 10 news headlines each belonging to different categories such as technology,sports,health,entertainment,politics by using only this four categories dont use other categories and store them in a dictionary where the key is category and value is headline

CODE:

```
palindrome.py >_
    # Write a code to classify 10 news headlines into different categories such as technology, sports, health, politics, entertainment, etc.
    news_headlines = [
        "technology": "New AI technology is transforming the tech industry",
        "sports": "Local team wins championship after a thrilling final",
        "health": "New breakthrough in cancer research offers hope",
        "entertainment": "Blockbuster movie breaks box office records",
        "politics": "Elections bring significant changes to the government",
        "technology_2": "Tech giant releases latest smartphone model",
        "sports_2": "Star athlete sets new world record",
        "health_2": "Study reveals benefits of a balanced diet",
        "entertainment_2": "Famous singer announces world tour",
        "politics_2": "New policies aim to improve education system"
    ]
    # Example usage
    for category, headline in news_headlines.items():
        print(f"{category.capitalize()}: {headline}")
```

OutPut:

```
PS C:\Users\thota\OneDrive\Desktop\AIAC> & C:/Users/thota/AppData/Local/Programs/Python/Python313/python.exe c:/Users/thota/OneDrive/Desktop\AIAC\palindrome.py
Sports: Local team wins championship after a thrilling final
Health: New breakthrough in cancer research offers hope
Entertainment: Blockbuster movie breaks box office records
Politics: Elections bring significant changes to the government
Technology_2: Tech giant releases latest smartphone model
Sports_2: Star athlete sets new world record
Health_2: Study reveals benefits of a balanced diet
Entertainment_2: Famous singer announces world tour
Politics_2: New policies aim to improve education system
PS C:\Users\thota\OneDrive\Desktop\AIAC>
```

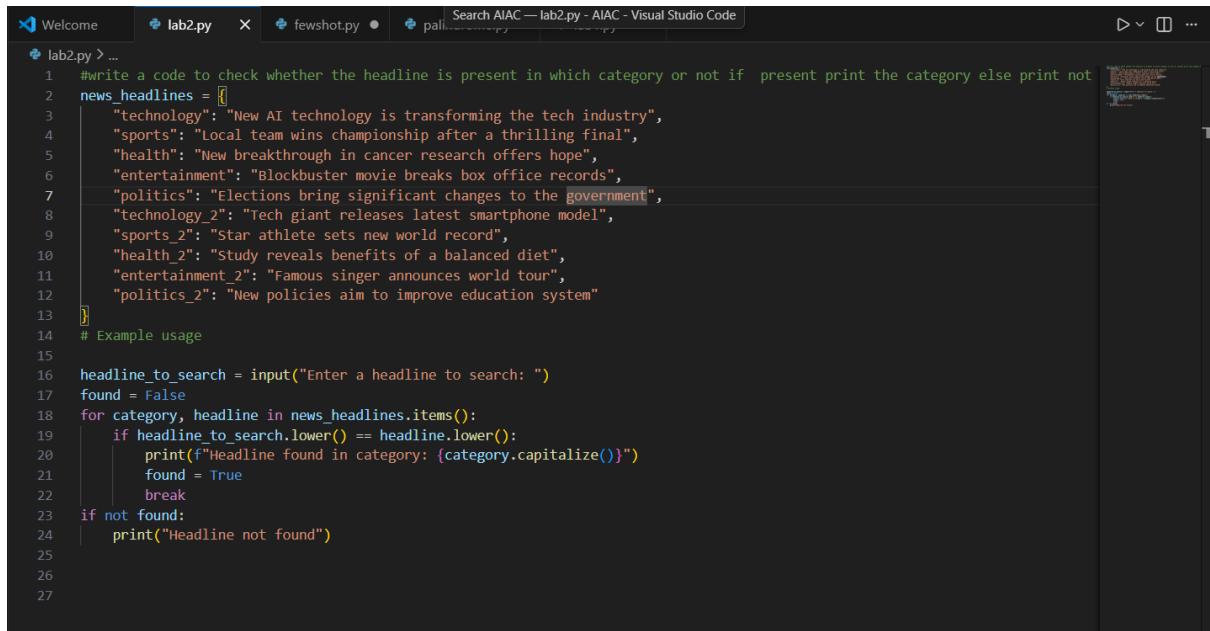

2. Zero-shot Prompting

Write a prompt asking the LLM to classify a headline into a category without examples.

Prompt:

#write a code to check whether the headline is present in which category or not if present print the category else print not found by using input user

CODE:

```
# Welcome lab2.py fewshot.py pal Search AIAC — lab2.py - AIAC - Visual Studio Code
lab2.py > ...
1 #write a code to check whether the headline is present in which category or not if present print the category else print not
2 news_headlines = [
3     "technology": "New AI technology is transforming the tech industry",
4     "sports": "Local team wins championship after a thrilling final",
5     "health": "New breakthrough in cancer research offers hope",
6     "entertainment": "Blockbuster movie breaks box office records",
7     "politics": "Elections bring significant changes to the government",
8     "technology_2": "Tech giant releases latest smartphone model",
9     "sports_2": "Star athlete sets new world record",
10    "health_2": "Study reveals benefits of a balanced diet",
11    "entertainment_2": "Famous singer announces world tour",
12    "politics_2": "New policies aim to improve education system"
13 ]
14 # Example usage
15
16 headline_to_search = input("Enter a headline to search: ")
17 found = False
18 for category, headline in news_headlines.items():
19     if headline_to_search.lower() == headline.lower():
20         print(f"Headline found in category: {category.capitalize()}")
21         found = True
22         break
23 if not found:
24     print("Headline not found")
25
26
27
```

OUTPUT:

```
PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS
PS C:\Users\thota\OneDrive\Desktop\AIAC> Elections bring significant changes to the government
● PS C:\Users\thota\OneDrive\Desktop\AIAC> & C:/Users/thota/AppData/Local/Programs/Python/Python313/python.exe c:/Users/thota/OneDrive/Desktop/AIAC/lab2.py
Enter a headline to search: Elections bring significant changes to the government
Headline found in category: Politics
Microsoft Teams
Ln 7, Col 71 Spaces: 4 UTF-8 CRLF {} Python
```

3. One-shot Prompting

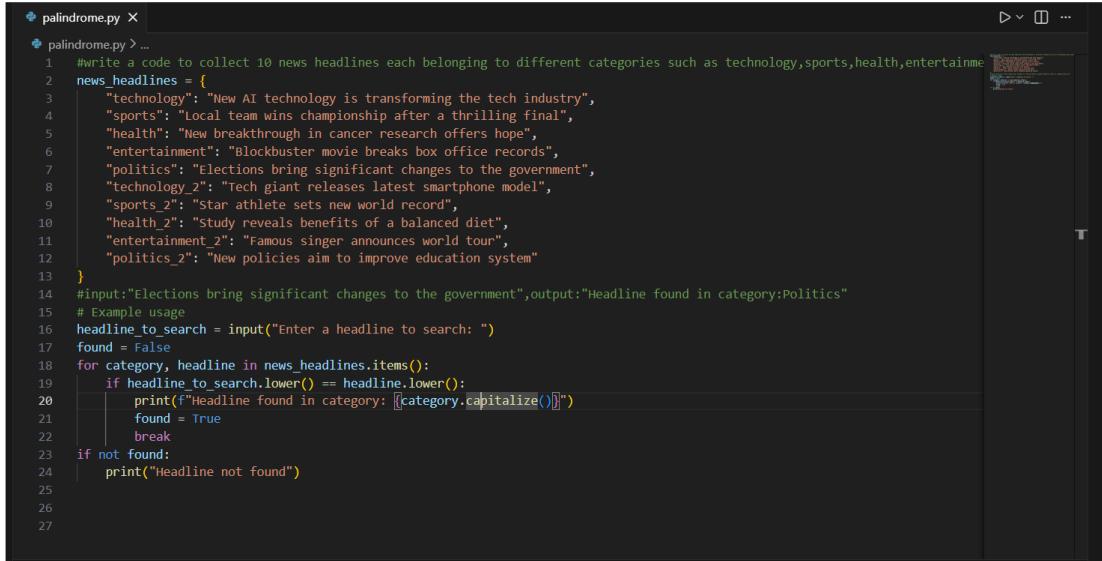

Add one labeled headline example before classifying a new headline.

PROMPT:

#write a code to collect 10 news headlines each belonging to different categories such as technology,sports,health,entertainment,politics by using only this four categories dont use other categories and store them in a dictionary where the key is category and value is headline

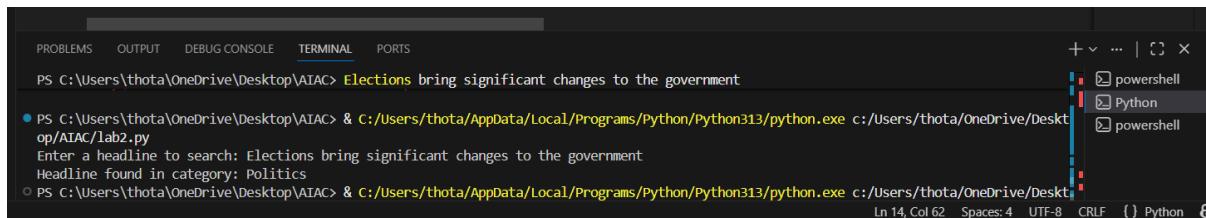

#input:"Elections bring significant changes to the government",output:"Headline found in category:Politics"

CODE:

```
palindrome.py > ...
palindrome.py > ...
1  #write a code to collect 10 news headlines each belonging to different categories such as technology,sports,health,entertainment, politics
2  news_headlines = {
3      "technology": "New AI technology is transforming the tech industry",
4      "sports": "Local team wins championship after a thrilling final",
5      "health": "New breakthrough in cancer research offers hope",
6      "entertainment": "Blockbuster movie breaks box office records",
7      "politics": "Elections bring significant changes to the government",
8      "technology_2": "Tech giant releases latest smartphone model",
9      "sports_2": "Star athlete sets new world record",
10     "health_2": "Study reveals benefits of a balanced diet",
11     "entertainment_2": "Famous singer announces world tour",
12     "politics_2": "New policies aim to improve education system"
13 }
14 #input:"Elections bring significant changes to the government",output:"Headline found in category:Politics"
15 # Example usage

```

5. Evaluation

Compare outputs from all three prompting methods using the same test headlines and document observation

Zero-shot:

We will not use any input examples in zero-shot .It will work with minimal instruction, but the output may be incorrect ..We will not provide any examples here.

One-shot:

We will use only one input for example in one-shot. It improves accuracy, as the AI understands the task better from a single labelled example.

Few-shot:

We will use more than one inputs for examples in few-shot.

It gives the best results. The AI shows higher consistency and correctly classifies most headlines.

As the number of examples increases, the AI's understanding of categories becomes clearer.

Therefore, few-shot prompting is the most effective method for news headline classification without training a model.

Customer Email Classification

1. Prepare five short sample emails, each belonging to one of the above categories.

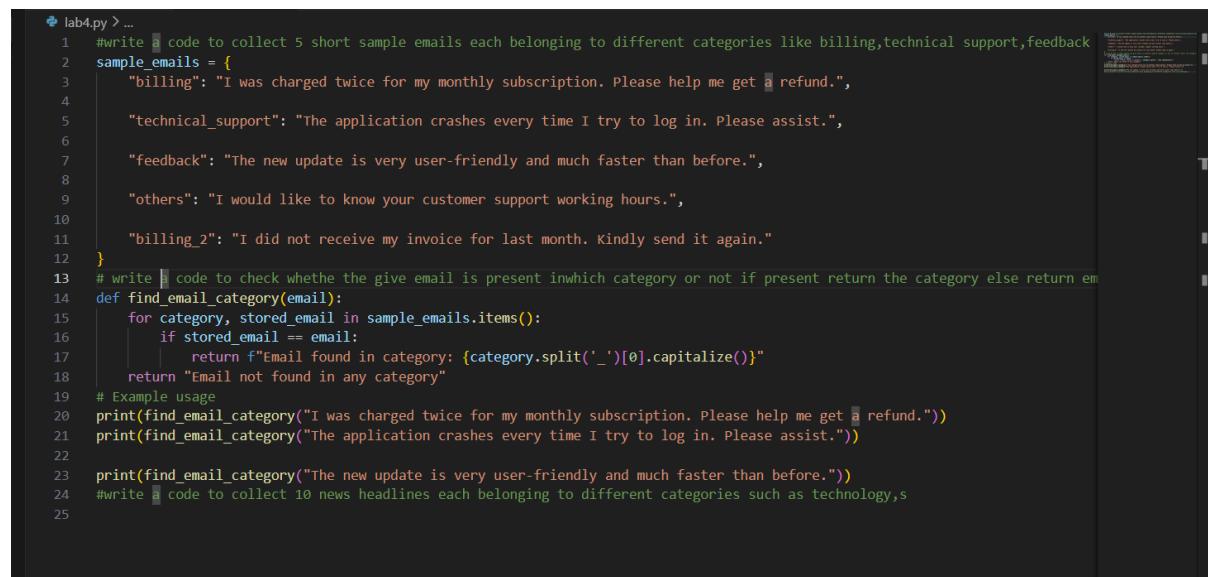

2. Write a zero-shot prompt to classify a given email into one of the categories without providing any examples.

Prompt:

#write a code to collect 5 short sample emails each belonging to different categories like billing,technical support,feedback and others by using only this four categories dont use other categories and store them in a dictionary where the key is category and value is email give examples

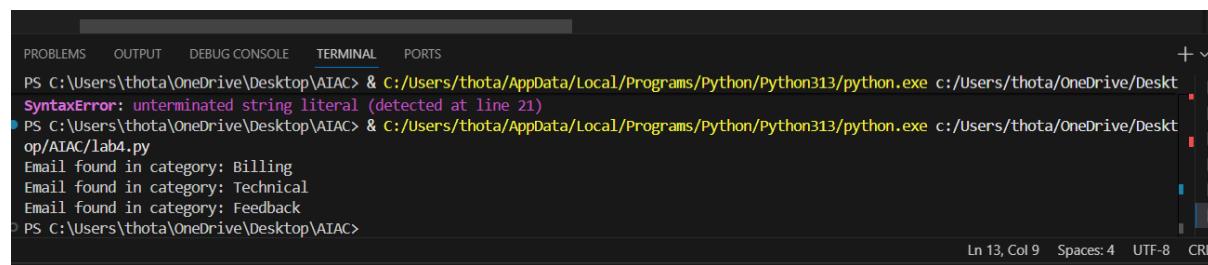

write a code to check whethe the give email is present inwhich category or not if present return the category else return email not found in any category

Code:

```
lab4.py > ...
1  #write a code to collect 5 short sample emails each belonging to different categories like billing,technical support,feedback
2  sample_emails = {
3      "billing": "I was charged twice for my monthly subscription. Please help me get a refund.",
4
5      "technical_support": "The application crashes every time I try to log in. Please assist.",
6
7      "feedback": "The new update is very user-friendly and much faster than before.",
8
9      "others": "I would like to know your customer support working hours.",
10
11     "billing_2": "I did not receive my invoice for last month. Kindly send it again."
12 }
13 # write a code to check whethe the give email is present inwhich category or not if present return the category else return em
14 def find_email_category(email):
15     for category, stored_email in sample_emails.items():
16         if stored_email == email:
17             return f"Email found in category: {category.split('_')[0].capitalize()}"
18         return "Email not found in any category"
19 # Example usage
20 print(find_email_category("I was charged twice for my monthly subscription. Please help me get a refund."))
21 print(find_email_category("The application crashes every time I try to log in. Please assist."))
22
23 print(find_email_category("The new update is very user-friendly and much faster than before."))
24 #write a code to collect 10 news headlines each belonging to different categories such as technology,s
25
```

Output:

```
PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS
PS C:\Users\thota\OneDrive\Desktop\AIAC> & C:/Users/thota/AppData/Local/Programs/Python/Python313/python.exe c:/Users/thota/OneDrive/Desktop\AIAC\lab4.py
SyntaxError: unterminated string literal (detected at line 21)
PS C:\Users\thota\OneDrive\Desktop\AIAC> & C:/Users/thota/AppData/Local/Programs/Python/Python313/python.exe c:/Users/thota/OneDrive/Desktop\AIAC\lab4.py
Email found in category: Billing
Email found in category: Technical
Email found in category: Feedback
PS C:\Users\thota\OneDrive\Desktop\AIAC>
Ln 13, Col 9  Spaces: 4  UTF-8  CR/LF
```

3. Write a one-shot prompt by including one labeled email example and ask the model to classify a new email.

Prompt:

#write a code to collect 5 short sample emails each belonging to different categories like billing,technical support,feedback and others by using only this four categories dont use other categories and store them in a dictionary where the key is category and value is email give examples

#Input: "The application crashes every time I try to log in. Please assist.",output:"technical_support"

Code and Output:

The screenshot shows a Visual Studio Code (VS Code) interface. The left sidebar has icons for file operations like Open, Save, and Find. The main editor area contains two files: 'palindrome.py' and 'lab4.py'. The 'lab4.py' file is open and contains the following Python code:

```
1 #write a code to collect 5 short sample emails each belonging to different categories like billing,technical support,feedback
2 sample_emails = {
3     "billing": "I was charged twice for my monthly subscription. Please help me get a refund.",
4     "technical_support": "The application crashes every time I try to log in. Please assist.",
5     "feedback": "The new update is very user-friendly and much faster than before.",
6     "others": "I would like to know your customer support working hours.",
7     "billing_2": "I did not receive my invoice for last month. Kindly send it again."
8 }
9 #Input: "The application crashes every time I try to log in. Please assist.",output:"technical_support"
10 def categorize_email(email):
11     for category, sample_email in sample_emails.items():
12         if email == sample_email:
13             return category
14     return "Category not found"
15 # Example usage
16 input_email = "The application crashes every time I try to log in. Please assist."
17 output_category = categorize_email(input_email)
18 print(f'Input: "{input_email}", Output: "{output_category}"')
19 
```

The right side of the interface features a dark-themed sidebar with a 'Build with Agent' section. It includes a message: 'AI responses may be inaccurate.', a 'Generate Agent' button, and instructions: 'Instructions to onboard AI onto your codebase.' Below this is a 'Build with Agent' button with a plus sign and a 'Build Live' button.

The bottom of the screen shows the Windows taskbar with various pinned icons. The terminal tab at the bottom displays the command-line output:

```
PS C:\Users\thota\OneDrive\Desktop\AIAC> & C:/Users/thota/AppData/Local/Programs/Python/Python313/python.exe c:/Users/thota/OneDrive/Desktop\AIAC\lab4.py
Email found in category: Feedback
PS C:\Users\thota\OneDrive\Desktop\AIAC> & C:/Users/thota/AppData/Local/Programs/Python/Python313/python.exe c:/Users/thota/OneDrive/Desktop\AIAC\lab4.py
Input: "The application crashes every time I try to log in. Please assist.", output: "technical_support"
PS C:\Users\thota\OneDrive\Desktop\AIAC>
```

4. Write a few-shot prompt by including two or three labelled email examples and ask the model to classify a new email.

Prompt:

#write a code to collect 5 short sample emails each belonging to different categories like billing,technical support,feedback and others by using only this four categories dont use other categories and store them in a dictionary where the key is category and value is email give examples

"""Input:"I was charged twice for my monthly subscription. Please help me get a refund.",output:"Email found in billing"

Input:"The application crashes every time I try to log in. Please assist.",output:"Email found in technical_support"

Input:"I would like to know your customer support working hours.",output:"Email found in others"""

Code and Output:

The screenshot shows a Microsoft Visual Studio Code (VS Code) interface. On the left is the code editor with two files open: `palindrome.py` and `lab4.py`. The `lab4.py` file contains Python code for categorizing emails into billing, technical support, feedback, and others based on user input. The terminal at the bottom shows the execution of the script and a syntax error at line 15. A sidebar on the right is titled "Build with Agent" and includes instructions for generating agent instructions.

```
1 #write a code to collect 5 short sample emails each belonging to different categories like billing,technical support,feedback
2 sample_emails = [
3     "billing": "I was charged twice for my monthly subscription. Please help me get a refund.",
4     "technical_support": "The application crashes every time I try to log in. Please assist.",
5     "feedback": "The new update is very user-friendly and much faster than before.",
6     "others": "I would like to know your customer support working hours.",
7     "billing_2": "I did not receive my invoice for last month. Kindly send it again."
8 }
9 """Input:"I was charged twice for my monthly subscription. Please help me get a refund.",output:"Email found in billing"
